ACIT 2811 - Individual Design

The designs we picked out for our application match our theme of plants very well.

When you think about plants, usually green comes to mind. Our site has different shades of green which match with the content of the application. We added light shades of green for our colour palette. We also added a darker green-black for contrast so that the text will be easy to read.

During the design process, our team had to make a decision on whether or not to include light shades of pink to the site. We had the choice of either adding a dark green-black navigation bar or a light pink navigation bar. It was a tough choice because, while the pink brought out the light shades of green, the darker green looked more visually appealing. We also asked a few classmates on which they prefer and the consensus was that dark green-black looked better. They also agreed that the darker colour fit more with our plant theme whereas the pink gave more of a floral atmosphere.

One design element that feels unresolved is whether or not we keep the scanned plants option on our desktop site. On the mobile app, it makes sense to have a scanned option because you can take photos or upload on your phone. On the desktop, you can really only upload a picture and people will most likely prefer to use their phones for that as well. We need to decide whether to make a scanned

plants view on the desktop application or not. Another unresolved issue is the logo.

We haven't decided on a logo for our application yet. Currently, we've just been using line art plant icons. We don't know whether to pick one of the icons or design a logo from scratch.
